WRITING

-> Use Secure Websites: Always ensure you are surfing on secure websites that use encryption (look for https:// and the padlock icon in the address bar).

-> Create Strong Passwords: Choose long, complex passwords that combine upper and lower case characters, numbers, and symbols. Do not use common dictionary words or easily guessable information like your name.

-> Never Share Passwords: Do not share your passwords with anyone, and make it a habit to change them routinely.

-> Protect Personal Information: Do not give away or share sensitive personal details online, such as your home address, phone number, daily routine, or personal likes and dislikes with strangers.

-> Be Cautious with Multimedia: Be very careful when uploading photos and videos of yourself, as this can expose you to unexpected dangers or privacy leaks.

-> Maintain Online Etiquette: Do not be rude, abusive, or disrespectful to other people on the internet.

-> Be Wary of Online Strangers: Do not make random friends online or trust individuals you have never met in real life.

-> Download with Caution: Be extremely careful about what you download. Never open links or email attachments sent by a stranger.

-> Verify Information: Be critical of what you read, a lot of information on the internet can be false or misleading. Do not believe everything blindly.

LISTENING

1. Why is cybersecurity important?

-> It protects sensitive personal and financial information from identity theft.

-> It safeguards corporate data and intellectual property from corporate espionage.

-> It secures critical national infrastructure (like power grids, hospitals, and transportation networks) from dangerous disruptions.

2. Did you know that there is a hacker attack every 39 seconds? Does this information make you feel scared?

-> Sample response: While this statistic is alarming, it shouldn't cause panic. Instead, it should serve as a wake-up call to practice good digital hygiene, such as using two-factor authentication, updating software regularly, and staying vigilant against phishing attempts.

3. Read the following brainy quote by Bruce Schneier. How do you understand it?

-> Interpretation: The quote emphasizes that security is not solely a technical problem that can be completely solved by buying a new software program or firewall. Security is a combination of technology, human behavior, processes, and policy. If you rely blindly on tech without training users and fixing habits, you will remain vulnerable.
